

# One person decisions: Games with and against yourself

#### **Lecture Outline**

#### http://www.youtube.com/watch?v=MoNs0mdKA 08

## **Lecture Outline**

- Using Marginal Analysis to guide decisions.
- Decision Trees
- How to draw
- Why they are useful (good to organize data, simplify the decision process. Communicate decisions to others)
- Examples:
  - Sunk cost dilemma
  - Nebraska versus Miami (1984 Orange Bowl)
- Thinning Strategically games against yourself. 3

# **Simple Decisions**

For many simple decisions, the best choice is often a matter of simply weighing the benefits against the costs and choose the highest number.

Go to university or not"

Benefit	Cost
Better paying job (+1M)	Tuition (-100K)
Better peers (+500K)	Rotten Profs (-750K)
1.5M	-850K

# **Decisions on the Margin**

- For many choices, though, the question is not "whether" but "how much?"
- You could try the approach above but a faster trick is to use "thinking at the margin"
- Suppose you are training for a marathon. How many miles a week should you run?
- The next slide shows the costs and benefits.

## **Running a Marathon**

- Suppose for each mile you run, you have to give up \$10 in wages.
- Initially, running a small number of miles per week has a big payoff.
- As you run more miles, the incremental (that is, marginal) payoff in terms of finish time (evaluated in dollars) declines.
- See the next slide.

#### **Costs and Benefits of Running**

## **Running a Marathon**

Where do you want to end up?

- □ A A? B? or C?
- What is the property of the best choice?
- Marginal benefit = marginal cost.

#### **Example: Maximizing Profits.**

- Suppose you are a monopoly providing tutorial services.
- Each hour costs you \$5 worth of tennis practice.
- As you provide more services, your revenue rises as follows:

Hours	1	2	3	4	5	6
Earni ngs	30	50	60	65	67	68

## Thinking at the Margin

	1	2	3	4	5	6
Earni ngs	30	50	60	65	67	68
Costs	5	10	15	20	25	30
Profit s	25	40	45	45	42	38
						10

# **Optimal Choice**

- When the choice is a quantity, the rule for the optimal amount is where the marginal benefit equals the marginal cost.
- (Marginal Benefit=increase in benefit from increasing q by one unit.)
- (Marginal Cost=increase in cost from increasing q by one unit.)

# Thinking at the Margin

		1		2		3		4		5		6	
Ear	nin	30		50		60		65		67		68	
gs													
Cos	sts	5		10		15		20		25		30	
Pro	fits	25		40		45		45		42		38	
	MB		20		10		5		2		1		
	MC		5		5		5		5		5		

### **Dynamic Decision-making**

#### **Decision Trees**

- Many decision must be made sequentially, often because some decisions must wait until other events occur.
- Decision trees are (sometimes) useful devices for organizing thoughts about these decisions.
- A decision tree is an ordered graph. It is a sequence of boxes and circles joined by lines.
- The boxes represent points where you make a decision. The circles are random outcomes.
- □ The lines are the choices you make or made by chance.

## **Decision Trees: Example**

- You hear that there is a 40% chance of rain.
- Should you bring your umbrella to campus?
- □ Here is a decision tree to help you out.

#### **Decision Tree Example**

# **Back to Front Reasoning**

- The typical way to "solve" this problem is to assign values to all the outcomes and find a path that maximizes (expected) value.
- However, we can save some of this by solving the game "back to front"
- For the collection of final decision nodes, find what you would choose to do.
- □ This process simplifies the game.
- □ Now assign values.

#### **Decision Tree Example**
